ISPs and malicious software (malware) security threats (The Role of Internet Intermediaries in Advancing Public Policy Objectives)

This chapter discusses the role and practices of Internet intermediaries in protecting information from damage caused by users to their own systems, to intermediaries' systems or to other systems. It builds on earlier and ongoing OECD work on malware, the economics of malware, and codes of practice for ISPs to increase security. It concludes with some of the lessons learned in this area.
